

AQUA DECANT™ FLOATING DECANTER SYSTEMS

- ✓ Designed to cause minimal disturbance of the sludge blanket, which can save sedimentation time
- ✓ Simple and robust equipment
- ✓ Manufactured in stainless steel
- ✓ Simple and easy installation
- ✓ Floating execution
- ✓ Designed to work with water level variations
- ✓ Discharges the clear supernatant after the settling cycle
- ✓ Avoids the aspiration and discharge of floatable materials
- ✓ Ideal solution for SBR reactors
- ✓ Flow range from 10 to >2.000 m³/h
- ✓ Adjustable flow
- ✓ 4 possible executions
 - Decanting with discharge by gravity
 - Decanting with discharge by pump
 - Decanting with mechanically closing system and discharge by gravity
 - Decanting with mechanically closing system and discharge by pump

AQUA DECANT™ discharge systems

Flexible hose up to DN150 or
Multiple flexible hoses (DN150)
with collector up to DN300

Telescopic discharge pipe up to DN450

Hinged discharge system up to DN450

AQUA DECANT™ mooring systems

Mooring with cables and compression springs

Mooring with vertical guiding posts on the side of the basin

Mooring with hinged discharge system and vertical guiding post on the bottom of the basin

Mechanically Closing Decanter with hinged discharge system

Description of the closing system and the flow regulation

- The Decanter with a Mechanically Closing system is equipped with a motorised Actuator, to open or close the gap between the overflow weir and the float.
- The discharge stops when the opening between the weir and the float is closed.
- The discharge system by gravity produces a flow which will vary with the water level; to limit the extent of these flow variations, one should install an additional valve downstream (see valve 2 above).
